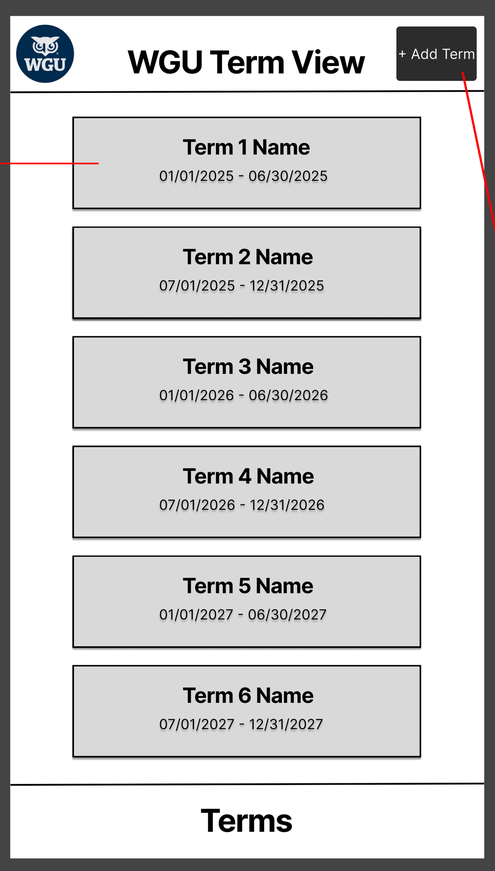
Any time the user is adding or editing a term/course/ assessment, the background color is beige.

When they are simply viewing a term/course/ assessment, the background is white.

This allows users to intuitively know if they are in a page where they can change a term/course/ assessment or simply view information.



The opening page is mostly the same. The terms do appear in a list view but the word "Term" was removed from the bottom as the "WGU Term View" title already made it clear what page the user was on.

Opted not to include the WGU logo to save room.

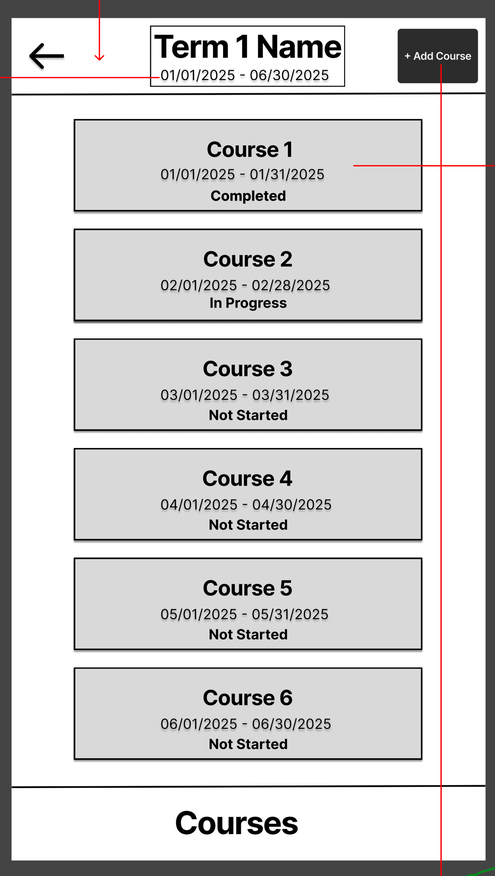
The +Add Term button is above the terms to make it easier for the user to see and click.

Added three new buttons "Edit, Delete, View". These buttons are clickable once the user selects a term first. This allows the user to decide what to do with a term on this one page instead of having to dig deeper into the app.

The Term View is mostly unchanged. The Courses word was removed from the bottom as it was redundant.

The Add Course button and the Back button are in the top center to make both easier to press.

Opted to use the text "Back" instead of an arrow since the button was moved from the top left corner to the top center.

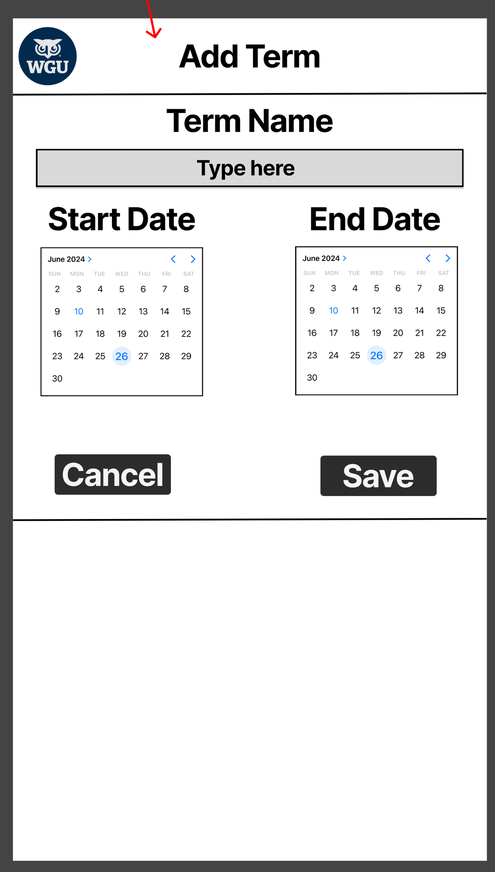


The Add Course page had a bit of a makeover but the functionality is the same.

Again, the DatePickers appear after first clicking on the box to edit them. This allows all information to be visible without needing to scroll.

Removed notification options from add course page. Moved them to the course view to consolidate all notification buttons onto one page.

Removed share button from add course page to pair it with the notification options in the course view. This allows users to set reminders and share notes later and not have to decide as they are adding a course.



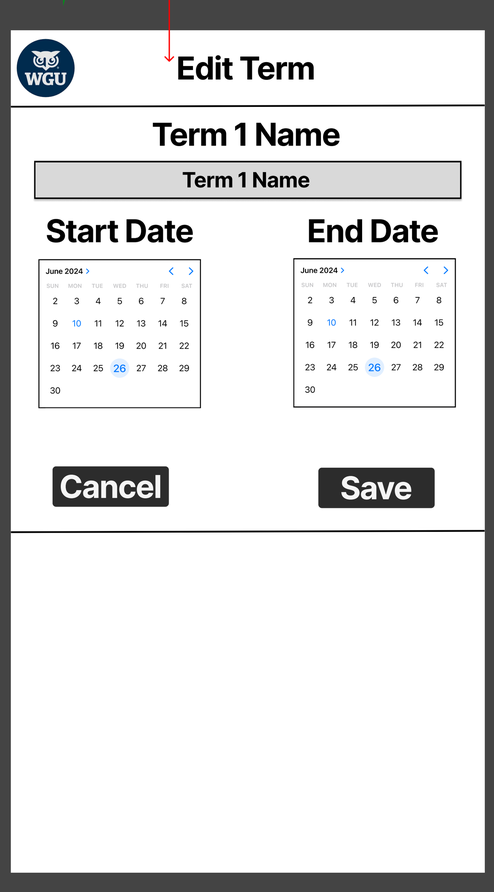
The Add Term page is mostly unchanged. The DatePickers appear only after clicking within their respective areas. This removes some clutter from the user's screen.

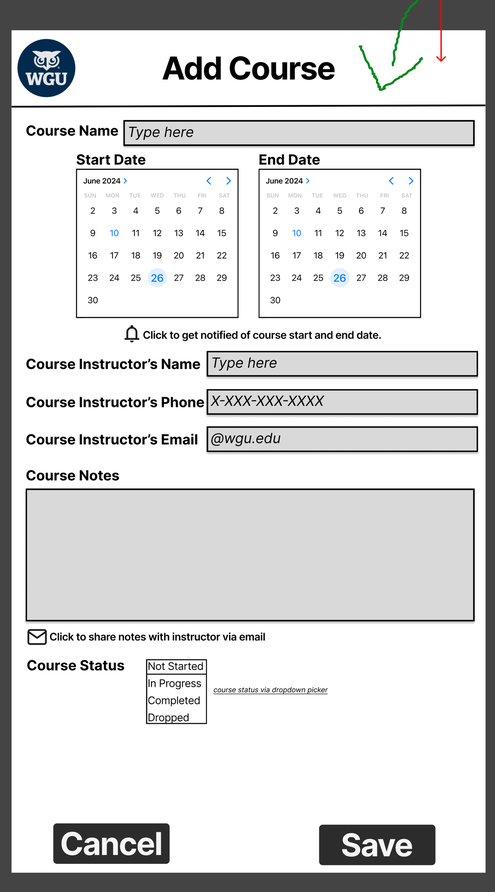
Opted to leave out logo to remove clutter and make a more generic, non-branded application.

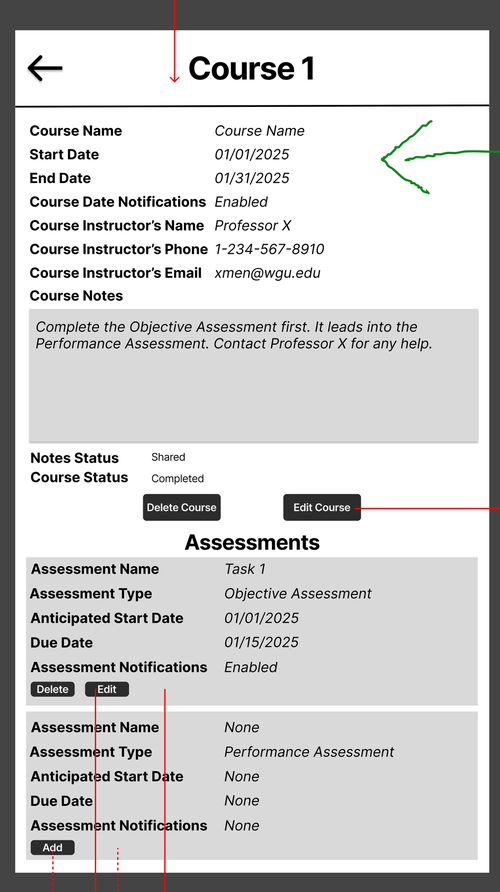
Cancel and Save buttons are colored to make it easy to know what to press without reading the entire button.

Edit Term is no longer reached by clicking the term name within the term view. Instead, users can click the term and select the Edit button. This makes it easier to choose what to do with a term without having to go as far into the app.

The Edit Term looks the same as the add term and the changes made here are the same as those specified in the Add Term page.







Moved the back button to the top middle to make it easier to click without the user having to stretch their hand as far and to remain consistent with other pages.

The Course Name through Course Status is left unchanged. Removed Notes Status as in development it was decided that sharing notes cannot be undone so showing the status was redundant.

Added a bell icon (reminder) and share icon above the Delete Course and Edit Course buttons. The icons are intuitive and can be long pressed to read a tooltip of what they are and do.

These buttons were placed on the Course View page so the users can access their features without having to 1) decide if they wanted to set a reminder or share notes when adding a course or 2) have to edit the course to later access these features.

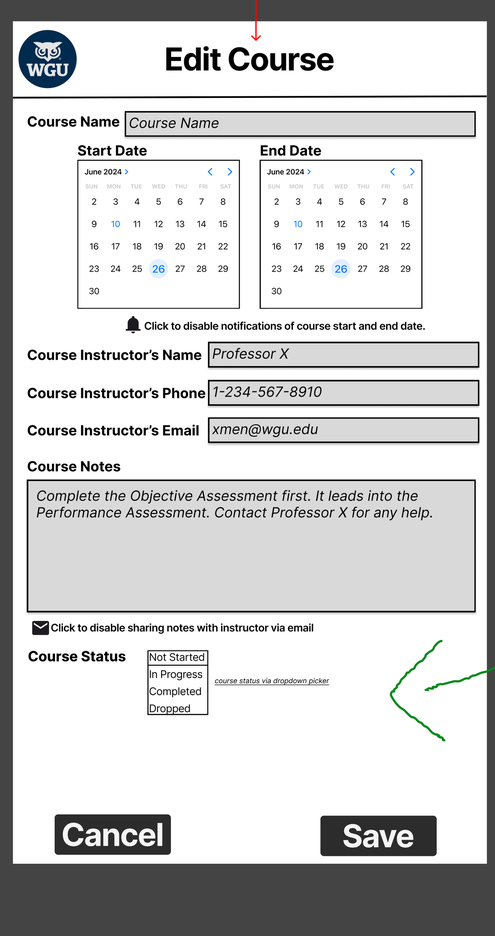
Moved assessment type to be a header as only one of each type can exist and this clarifies that to the user.

Kept the functionality to make the Delete, Edit, and Add buttons appear/disappear as necessary so users can only access the appropriate features at any given time.

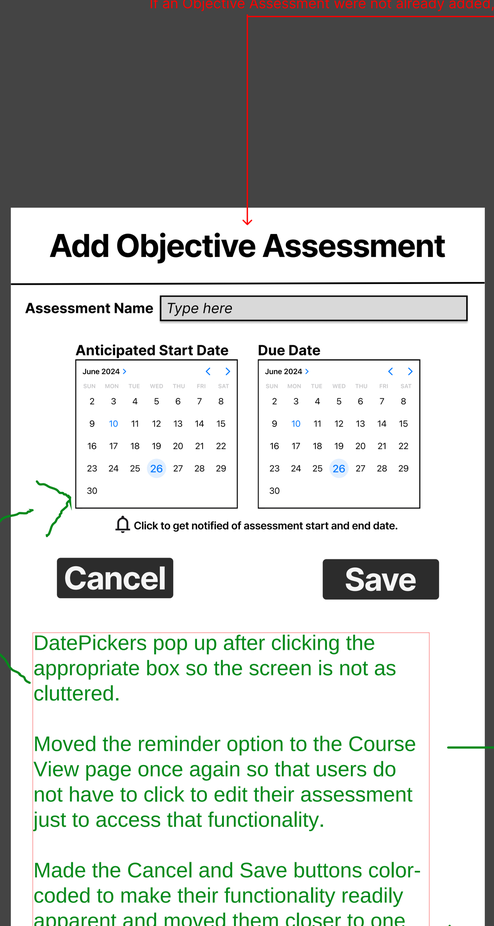
Added a bell icon to set reminders for each assessment. The icon only appears after the assessments are first added so the user can only set a reminder for an assessment that exists. Removed reminder options from the add/edit pages of each assessment so users can access the functionality for both assessments and their course on one page.

Removed assessment notifications text. Users can click the bell icon and it will inform them if they already have a notification set.

If an Objective Assessment were not already added, the user would only see an "Add" button that would take them to this page.



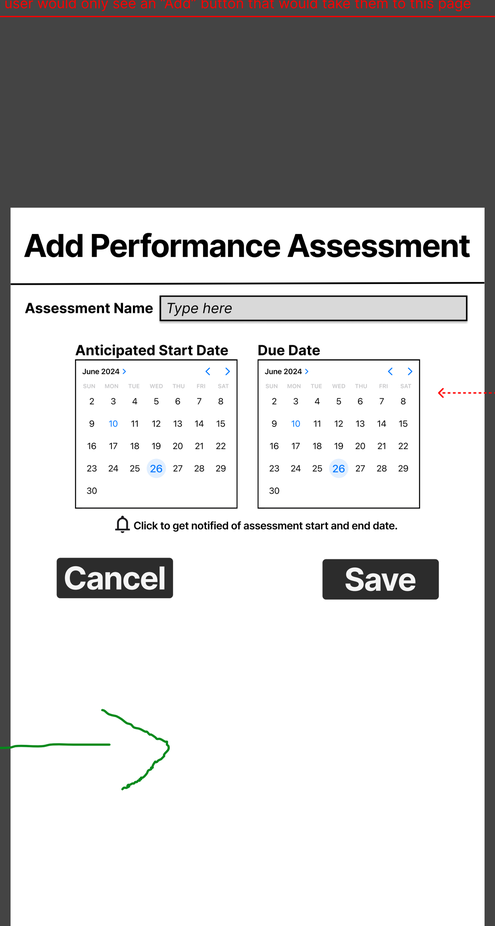
The edit course page reflects the same design changes as in the add course page, namely moving the reminder and sharing options to the Course View page for the same reasons as previously mentioned.

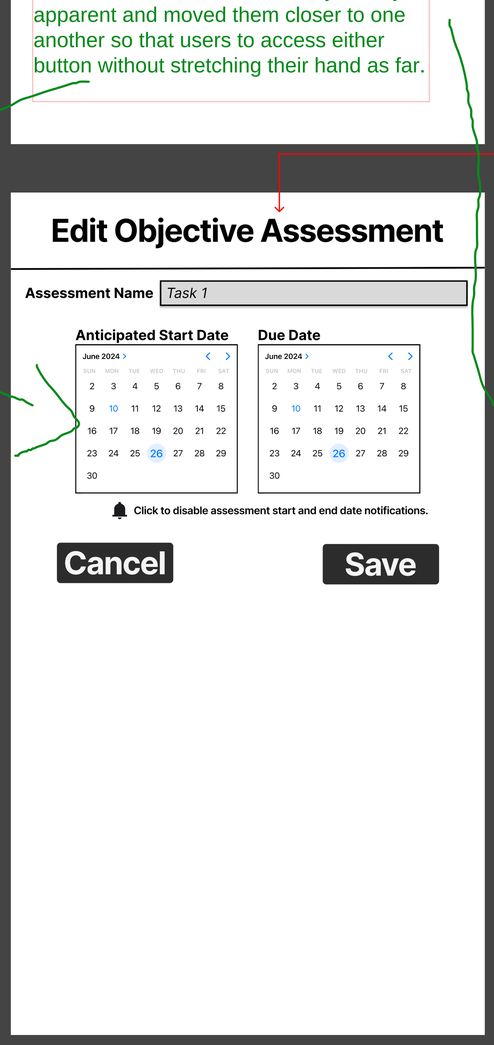


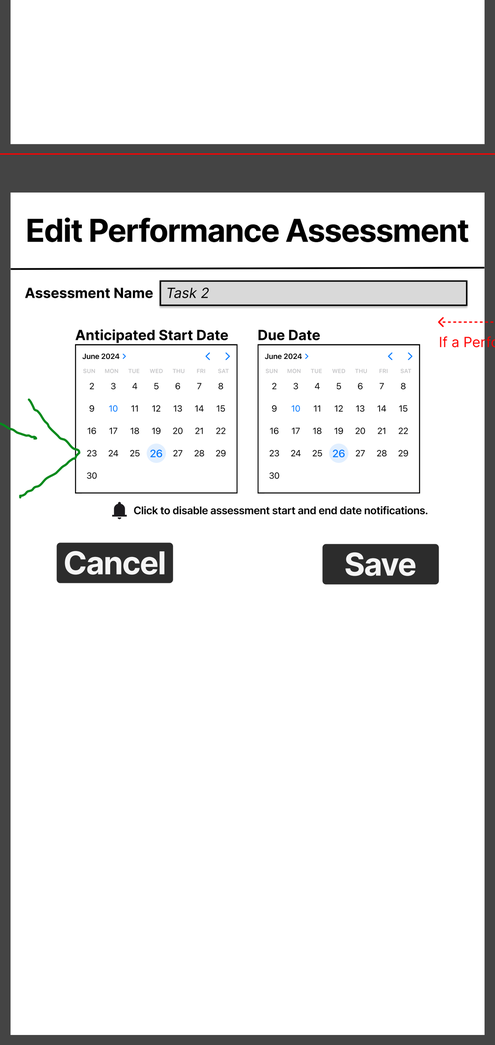
DatePickers pop up after clicking the appropriate box so the screen is not as cluttered.

Moved the reminder option to the Course View page once again so that users do not have to click to edit their assessment just to access that functionality.

Made the Cancel and Save buttons color-coded to make their functionality readily apparent and moved them closer to one another so that users to access either button without stretching their hand as far.







If a Performance Assessment were already added, the user would see an "Edit" button that would take them to this page.

Part D2:

After including the commented changes in my wireframe, I can confidently say that my wireframe perfectly aligns with the completed mobile applicaiton from part C.

The comments clearly indicate the changes I made and their reasonings. With the first version of the wireframe acting as a baseline and adding onto it the comments I included, the wireframe aligns with my completed mobile application from part C.
